
PRESS RELEASE

Grupo Bolsa Launches its Colocation Service

Mexico City, Mexico, November 19, 2009. --- Bolsa Mexicana de Valores, S.A.B. de C.V. (BMV: Bolsa), announced today that it launched its Colocation service on November 12th, which will be offered to all its trading members immediately. The new service allows members to colocate their trading equipment and proprietary algorithms next to the Bolsa Group Central Trading Engine, allowing members "to have electronic traders back in the trading floor". This is a unique opportunity for high frequency traders and algo traders to execute at the lowest latencies available in the market.

The Bolsa's cross border indicators show an increase in the volume and number of trades executed through Sentra Captales since 2004, indicating that the Mexican market is also following the trend of automated trading and order execution. As such, the Colocation service meets the speed requirements for cross border trading, offering latencies below 1 millisecond.

The service envisions the installment of cross border servers for members of BMV, MexDer and real-time information distributors next to the Bolsa Group Central Trading Engine to increase transmission speed along with top-line service, ongoing monitoring to networks and redundancies at each point of service.

Members of the Bolsa Mexicana de Valores and the Mercado Mexicano de Derivados, as well as cross border information distributors, Bursatec and other technology suppliers attended the launching event.

In the financial industry, where trading execution speed is of the utmost importance, the service of colocation places you right next to your partner, in the same physical center, offering speed and reliability in their transactions. This project follows the trend to further adopt international standardization practices.
